Consider  $\triangle ABF$  and  $\triangle FOY$ . These are similar triangles. We can, therefore, write  $\frac{AB}{OY} = \frac{BF}{OF}$  (20.1) Similarly, from similar triangles  $\triangle XOF$  and  $\triangle BCF$ , we have  $\frac{XO}{BC} = \frac{OF}{CF}$  (20.2) But  $AB = XO$ , as  $AX$  is parallel to the principal axis. Also  $BC = OY$ . Since left hand sides are equal,  $\frac{AB}{OY} = \frac{XO}{BC} = \frac{OF}{CF}$  (20.3)

Note: Some of these concepts should be a review from fifth-grade science. Be sure to relate them to solar energy. Procedure 1. Have each student fill a tall, clear glass or bottle with water and place a sheet of white paper on the back side of the glass so that when students look through it, the image of the object is inverted. This is because the light rays are refracted twice, once when they enter the water and once when they exit the water. The image is inverted because the light rays are bent towards the normal when they enter the water and away from the normal when they exit the water. This causes the image to be upside down.

For an object, i.e.,  $M = \frac{H_i}{H_o} = \frac{v}{u}$  Linear magnification is negative for real image but positive for virtual image. If  $u < f$ ,  $v$  is positive and  $M$  is positive. If  $u > f$ ,  $v$  is negative and  $M$  is negative.
